

Customer 360 Analytics

Executive Summary

The objective of this project is to provide a unified view of a ecommerce business where data stored across different subsystems. The project aims at integrating, analysing and identifying key drivers for business growth and customer satisfaction.

Dataset Description

The dataset contains the following tables

Customers - Contains customer identification and demographic information. Each order is associated with a customer id tied to the order. The real customer is identified by the customer_unique_id key

Location - Contains the zip code prefix along with latitude/longitude and city/state

Order_item - This is the line item in the order and contains data associated with the item such as product identification, seller identification and price information

Orders - It contains the order identification, and purchase and delivery status information

Payments - It contains the payments associated to the order. The payment system supports multiple installment and hence the same order is associated to multiple payment records matching on order_id

Products - Contains product description and details

Reviews - Contains feedback information

Sellers - Contains the seller information

Category_translation - Contains the product category information

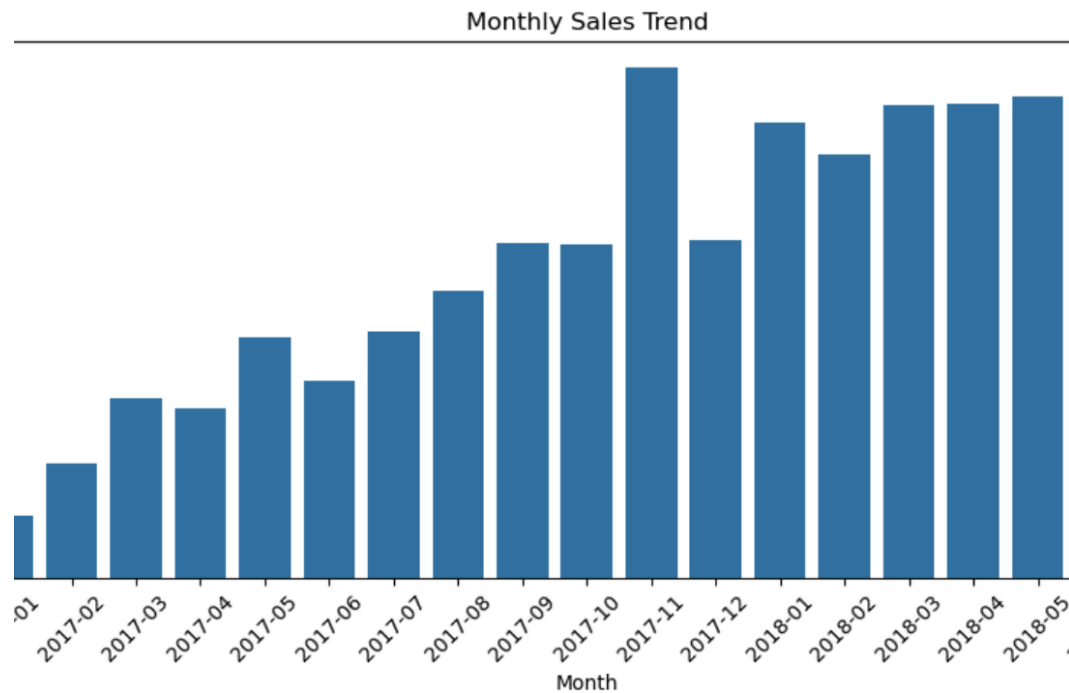

Methodology

The data was first loaded and extracted. It was then clean and prepared for analysis.

The tables were then normalized and Exploratory Data Analysis was performed on the normalized table.

Key Findings

The sales has been declining in the last two months.

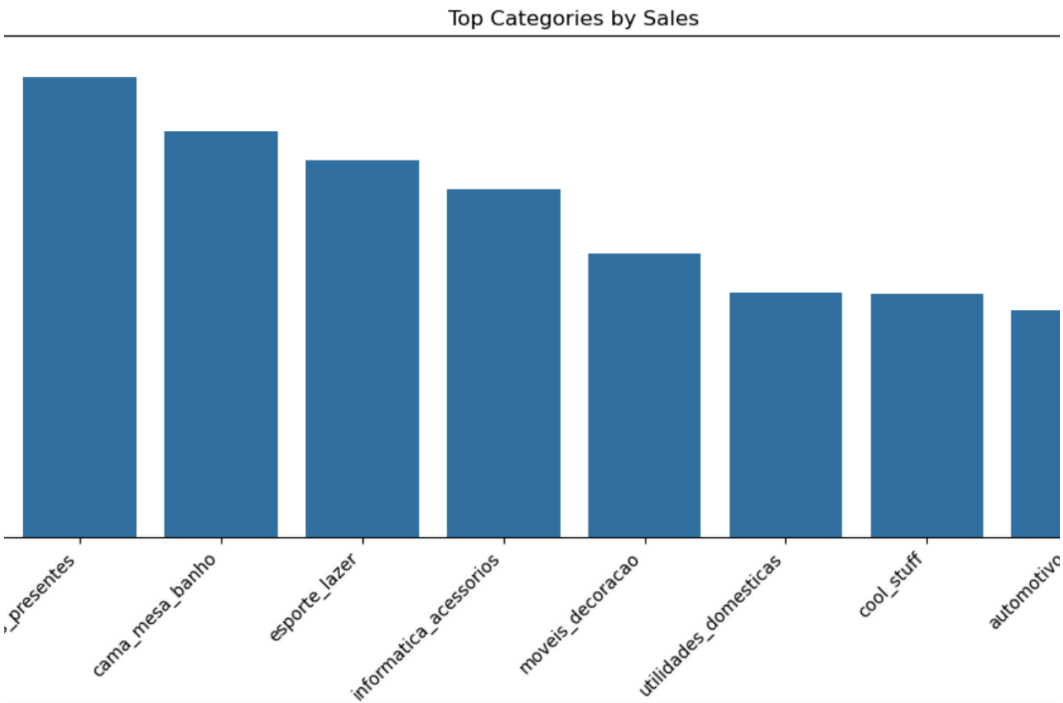

Monthly Sales Trend

Business Insights

Beauty and Health, Religious Gifts and Bed and Bath products drive the top revenue.

The top 3 state with highest customers are São Paulo, Rio de Janeiro, Minas Gerais

The 3 state with least customer base is Roraima, Amapá, Acre

Top Selling Product Category

Recommendations

Delivery for some products takes more than 100 days and customers are not happy and it reflects in the score. Operational delays need to be investigated and appropriate action must be taken to reduce the delay.

The customer base should be improved for the city/states with least customers. Marketing promotions in these states could help attract potential customers.

High value customers should be retained by personalized service and more discounts.
